TO: Users of Population Projections for the State of Connecticut and Connecticut Municipalities

FROM: Gary E. King, Under Secretary
Comprehensive Planning Division

SUBJECT: Age and Sex Distributions of Population Projections for the State of Connecticut, Regions and Municipalities to the Year 2000 -- June 1983

Forwarded are "Age and Sex Distributions of Population Projections for Connecticut Municipalities and Regions to the Year 2000". This report serves as an adjunct to the population projections promulgated in June 1982. These population projections with age and sex distributions are to be considered as guidelines and baseline data to be utilized in plans and activities involving all state programs. The methodology for the preparation of the age and sex distributions of the population projections is contained in this report.

These age and sex distributions should be utilized until a further series of population projections are developed. Specific inquiries concerning these population projections or their use may be addressed directly to the Under Secretary, Comprehensive Planning Division, of the Office of Policy and Management. Staff may be contacted at 566-8285.

We express our appreciation to the Department of Health Services and the Department of Higher Education which provided information or assisted in the preparation of this report. Data processing for this report was accomplished at the Institute for Social Inquiry, University of Connecticut.

We believe these age and sex distributions of the population projections represent the best current determination of future population distributions of State of Connecticut, its regions and municipalities.

AGE AND SEX DISTRIBUTIONS
OF
POPULATION PROJECTIONS
FOR THE
STATE OF CONNECTICUT, REGIONS AND MUNICIPALITIES
TO THE YEAR 2000

Introduction

The Comprehensive Planning Division, Office of Policy and Management (OPM), in consultation with the Division of Health Statistics, Department of Health Services (DHS) and the Department of Higher Education (DHE), has prepared age and sex distributions of the June 1982 "Population Projections for Connecticut Municipalities and Regions to the Year 2000". Processing of the data and preparation of the tabulations associated with this report were done by the Institute for Social Inquiry at the University of Connecticut. This report, showing age and sex distributions of the population projections, utilizes detailed age and sex information from the 1980 Census of Population and Housing and current birth and death data.

This report on age and sex distributions is a detailing of the report titled: "Population Projections for Connecticut Municipalities and Regions to the Year 2000" dated June 1982. The June 1982 report, which was prepared in consultation with the Connecticut regional planning organizations, established population projections which were consistent with the 1980 Census of Population and Housing. The population projections should be viewed as a modified population trend projection series, rather than as pure trend projections. The projections are approximations around which future populations may vary. The population projections issued in June 1982, and in turn these age and sex distributions, continue to assume the trends associated with population projections originally promulgated in February 1980. The trends are based upon assumptions concerning births, deaths, and migration. Municipal, regional, and state policy actions, in effect or anticipated for implementation, as well as economic activity, were also taken into consideration. The accuracy of the projections tends to decrease as the projection period lengthens. Users may wish to refer to the June 1982 report for more detailed explanation of the methodology, general assumptions and highlights associated with the population projections.

The 1982 population projections, upon which these age and sex distributions are based, with some exceptions, generally fall below previous projections at the regional and municipal levels. The 1980 Census figures for Connecticut show a population of 3,107,576, a four (4) percent reduction from the projected figures in the previous population projections report dated February 1980. The state, between 1970 and 1980, experienced a 2.2% growth. Other projections, including those prepared by the U.S. Department of Commerce, Bureau of Economic Analysis and Bureau of the Census, have shown a slower growth rate in recent years. Other population projections exist and may be evaluated on their merits.

These age and sex distributions of the population projections are consistent with the age and sex distributions from the 1980 Census of Population and Housing. The assumptions and associated growth trends utilized to develop the preceding population projection reports continue to be recognized as reasonable. This report provides sex and age detail, in 18 age cohorts, for the state, planning regions, health service areas, counties, and municipalities. Cautious use of this data should be exercised for the smaller geographic areas as the data is subject to greater variability.

Methodology

Circulation of the June 1982 population projections, fostered an immediate demand for age and sex distributions. Options subsequently considered included: (1) initiating a new series of population projections which would include age and sex distributions, or (2) preparing age and sex distributions based on the population projections promulgated in June 1982. The latter option was chosen due to delays in the receipt of census based migration data necessary for new population projections and a lack of staff available to initiate a new projection series.

Subsequently, the Department of Health Services, Division of Health Statistics and the Department of Higher Education cooperated in providing data and assistance within their respective areas of responsibility. The Office of Policy and Management, Comprehensive Planning Division provided overall coordination in the preparation of the age and sex distributions of the population projections. Computer processing of the age and sex distributions was accomplished at the University of Connecticut, Institute of Social Inquiry.

A cohort component method was utilized in developing the age and sex distributions of the population projections. A "cohort" is defined as an age distribution (or grouping) of persons by sex in a particular projection year. The "components" used were births and deaths. Migration, a usual third component, is included in the age and sex distribution totals through the process of controlling to the to the June 1982 population projections upon which this report is based and which considered the migration component. Adjustment factors were calculated and applied to each cohort to achieve consistency with the June 1982 population projections.

Assumptions were made for the two components, births and deaths, for each municipality. The number of persons in the cohorts were moved from the 1980 base year to the next five-year period, by applying specific municipal birth and death data -- fertility rates and survival rates -- which yielded a net change in the number of persons in the next succeeding cohorts. Birth and survival rates, based on empirical data, were assumed to be constant during the projection period.

Data utilized to prepare the age and sex distributions was obtained from the following sources:

Department of Health Services, Division of Health Statistics; Special Tabulation of Number of Births by Age of Mother (between ages 15 and 44) in 5 Year Cohorts for each Municipality.

Department of Health Services, Division of Health Statistics, Special Tabulation of Death by Sex in 5 Year Age Cohorts Between the Years of 0 and 100+ for each Municipality.

U.S. Bureau of the Census, 1980 Census of Population and Housing Summary Tape File 2 (File B - Municipal (Minor Civil Division) and File A - Census Tract) Tabulation of Sex and Age by Single Years, Table B-8.

Office of Policy and Management, Comprehensive Planning Division, "Population Projections for Connecticut Municipalities and Regions to the Year 2000", dated June 1982.

The special tabulations prepared by the Department of Health Services contained data on the average number of births and deaths from the years 1978, 1979, 1980, 1981, and six months of 1982, to alleviate anomalies which may have occurred in a municipality during one year. Table B-8 of Summary Tape File (STF) 2, from the Bureau of the Census, provided age and sex detail on the 1980 base year. The population was projected for the years 1985, 1990, 1995, and 2000.

Although data for cohorts of 85-89, 90-94, 95-99 and 100+ were sought, empirical data utilized to calculate survival rates, when applied to these cohorts having small numbers of persons, resulted in negative survival rates. The use of negative survival rates yielded unrealistic data due to too few persons being in the sex and age specific cohort. As a result, these age groupings were combined into a cohort of 85+ and the few remaining negative survival rates were assumed to be zero. As a result, most problems were resolved; a few anomalies are identified in the precautions noted below.

Group quarters, especially where considered to be relatively significant in a municipality or cause an unusual age distribution pattern, were evaluated. The evaluation occurred on a census tract basis. Two factors facilitated the use of tracts: (1) Connecticut is totally tracted and (2) sex and age by single year data is available for each tract.

Tracts, which have a significant proportion of its population in group quarters and which contained an unusual age distribution pattern due to an identifiable reason, were held constant within the cohort component method when preparing the age and sex distributions. Most of the group quarter facilities were identified as higher education facilities or military installations. Some adjacent housing is also included within some of the tracts which were identified. In each situation, the age and sex distribution of the persons is assumed to be constant over the period of the projections.

All census tracts within Connecticut were evaluated. From the evaluation, 39 tracts were identified and selected as being significant in terms of group quarters. The tracts are listed on Table 1, with tabulations showing the group quarters data and the basis for the selection. (Table 1 is located on pages 6 though 8 of the introduction.) Several tracts, although containing significant group quarters, could not be selected due to the relative size of the tract in comparison for the municipality or the inability to sufficiently isolate the qroup quarters in reviewing the tract data.

Several precautions are listed in the use of the age and sex data. The precautions, identified as a result of a review of the data, are not considered to be all inclusive; they do however, provide a better understanding of the opportunities and limitations associated with the use of the data.

1. Municipalities, which are small in population and which may be one tract municipalities, may include group quarters which could not be isolated. Therefore, the age and sex distribution of persons in the group quarters, especially associated with educational facilities was not held constant and may reflect an aging of the school population within the municipality. However, census enumerator procedures provide that persons under the age of 17 in educational facilities are to be coded to the location of their parents, and not at the location of the facility.

2. Municipalities with high housing costs and limited housing supply may show some projected cohorts with a proportion of persons which is higher than might be expected. School age children in these municipalities may not remain in the respective municipalities due to the supply and cost of housing. As school children age into the 20-24 and 25-29 age cohorts, they may be expected to move from the municipality, thus causing a greater stability in the age and sex distributions than shown due to the resultant migration patterns associated with families (parents with school age children) able to afford the available housing.

3. Municipalities with a preponderance of retired/elderly housing yield empirical data inconsistant with the age and sex distribution procedures. One municipality, the Town of Southbury, with Heritage Village, contains one tract in which nearly 60% of the persons are between the ages of 65 and 85. The tract comprises 39% of the Southbury population; (22% of the town's population is in that age category). Due to the age restrictions associated with the residents of Heritage Village, the cohorts in the census tract which includes Heritage Village are held constant.

4. Negative survival rates were experienced in the Towns of Canaan, Kent, Roxbury, Salem, and Union in a few of the 85+ cohorts. A zero for data in these cohorts is consistant with the pattern of data for the town. Negative survival rates were experienced in the Town of Southbury but are mitigated by holding the tract containing Heritage Village constant.

5. The sum of the cohorts for any projected year may not total to the projections due to rounding.

Conclusions/Observations

The age and sex distributions of the population projections are especially reasonable when aggregations of municipal age and sex population projections to the state, planning region and health service areas are considered.

The baby boomette in the late 1950's and 1960's resulting persons, both male and female, in the 10-24 years of age range in 1980, appears in Year 2000 cohorts with some dispersion in the 30-49 years of age range. Careful consideration of the extent of future educational facilities needed to educate and train or retrain these persons beyond 1985 is required; data for municipalities and applicable regions should be considered. It also suggests the need for extended occupational opportunities lest we see a greater migration which yields a slightly negative net growth rate for the state in the late 1990s.

Elementary age children remain relatively stable in numbers, especially as the women associated with the baby boomette become of child bearing age and yield an additional number of children. With some women delaying birth, again a dispersion of younger age persons appears in the population projections.

Significant changes are noted in the over 65 population for the State of Connecticut. Increases in the elderly population grouping are indicated: 1980 -- 364,864; 1985 -- 416,404; 1990 -- 476,723; 1995 -- 519,606; and 2000 -- 535,756. The over 85 age grouping does not begin to increase until after 1985, while the 65-69 age grouping appears to peak in 1990. The rate of increase, however, peaks between 1985 and 1990, with an increase of approximately 60,000 persons in the over 65 age grouping; the increase between 1995 and 2000 is approximately 16,000 persons. These changes, for the elderly population, indicate evolving needs associated with health care facilities and services, social services, housing, etc.

These projections with age and sex distributions provide insight into the dynamics occurring with the population as it is projected to the year 2000.
